# SQL PROJECT ON Customer Behaviour-Analysis On Dummy Data

It focuses on examining patterns, trends, and factors influencing customer spending in order to gain insights into their preferences, purchasing habits, and potential areas for improvement in menu offerings or marketing strategies in a dining establishment.
Background
Mani seriously loves Japanese food so in the beginning of 2021, he decides to embark upon a risky venture and opens up a cute little restaurant that sells his 3 favourite foods: sushi, curry and ramen. Danny's Diner is in need of your assistance to help the restaurant stay afloat - the restaurant has captured some very basic data from their few months of operation but have no idea how to use their data to help them run the business.

```sql
select * from members
select * from sales
select * from menu
```
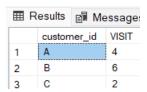

```sql
--1. What is the total amount each customer spent at the restaurant?

select customer_id,sum(price) as total_spent
from sales s
join menu m
on s.product_id=m.product_id
group by customer_id
```

	customer_id	total_spent
1	A	76
2	B	74
3	C	36

```sql
--2.How many days has each customer visited the restaurant?

 select customer_id,count(distinct order_date) as VISIT
from sales s
join menu m
on s.product_id=m.product_id
group by customer_id
```
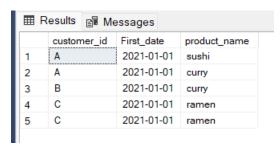

|	customer_id	VISIT
1	A	4
2	B	6
3	C	2

```sql
--3. What was the first item from the menu purchased by each customer?

 with cutomer_first as
        (select customer_id,min(order_date) as First_date
        from sales
        group by customer_id)
        select cf.customer_id,cf.First_date ,m.product_name
        from cutomer_first cf
        join sales s
        on s.customer_id=cf.customer_id
        AND cf.First_date=s.order_date
        join menu m on m.product_id=s.product_id
```
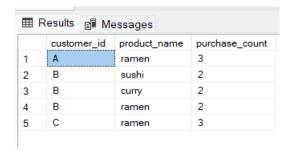

Results Messages
